

How effective is my contraceptive method?

In 1 year, what are my chances of getting pregnant?

>99%
Set and forget

Contraceptive implant

99.95% effective
Lasts up to 3 years

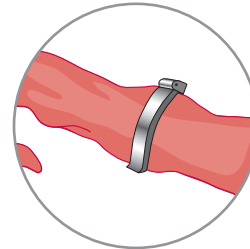

Hormonal IUD

99.9% effective
Lasts up to 5 years

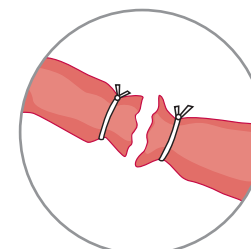

Copper IUD

99.5% effective
Lasts 5-10 years

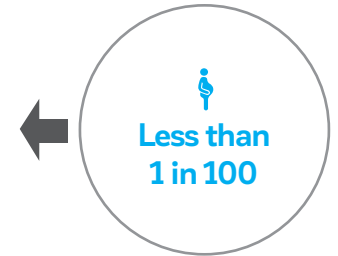

Tubal surgery

99.5% effective
Permanent

Vasectomy

99.5% effective
Permanent

93-99%
Works well if used perfectly every time

Contraceptive injection

Used typically 96%
Used perfectly 99.8%

Vaginal ring

Used typically 93%
Used perfectly 99.5%

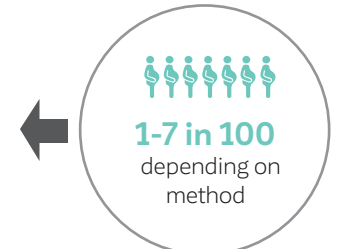

The Pill (COC)

Used typically 93%
Used perfectly 99.5%

The Pill (POP)

Used typically 93%
Used perfectly 99.5%

76-99%
Less effective methods

Condom external

Used typically 88%
Used perfectly 98%

Condom internal

Used typically 79%
Used perfectly 95%

Diaphragm

Used typically 82%
Used perfectly 86%

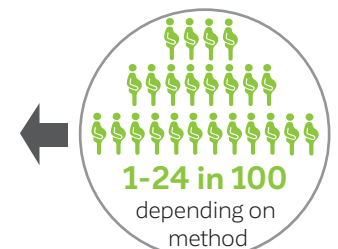

Fertility awareness

Used typically 76 - 93%
Used perfectly 95-99.5%

Pulling out

Used typically 80%
Used perfectly 95%

Used perfectly – when the rules are followed perfectly EVERY time

Used typically – real life use where mistakes can sometimes happen (for example: forgetting a pill, condom not used correctly).

If you experience unwanted side-effects with your contraceptive method, it is important to seek medical advice from a health professional.

Without contraception around 80 in 100 women of reproductive age will get pregnant in a year.

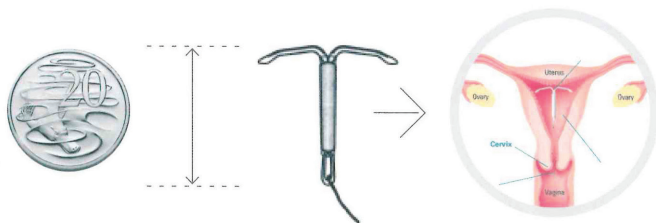

'Set and forget' Long-Acting Reversible Contraception (LARC)

Hormonal Intra-uterine device (Hormonal IUD) or Copper Intra-uterine device (Copper IUD)

The hormonal and copper-IUDs (pictured right) go inside the uterus.

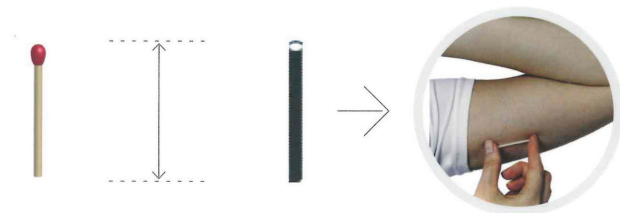

Approximate size (not to scale)

Contraceptive implant

The implant (pictured right next to match-stick) goes under the skin of the arm.

Approximate size (not to scale)

- The hormonal IUD slowly releases a very small amount of progestogen hormone into the uterus and lasts for 5 years. It is on the Pharmaceutical Benefits Scheme and it is very cost effective after it has been inserted.
- The copper IUD contains no hormones and lasts for 5 or 10 years depending on which type you choose. It is not subsidised by the government but it is still very cost effective after it has been inserted.
- The contraceptive implant is a soft, flexible rod that is placed under the skin of the arm. It slowly releases a small amount of progestogen hormone and lasts for 3 years. It is subsidised by the government and it is very cost effective after it has been inserted.
- Each of these LARC methods can be removed at any time; they are immediately reversible.

Choosing the best contraceptive method for your individual circumstances depends on many factors

- how effective is it?
- how much does it cost?
- is it permanent or reversible?
- how long does it last?
- how often do I need to take it/use it?
- what are the side-effects and risks?
- does it have other benefits for menstrual periods or acne?
- do you have any medical conditions that affect what you can use?
- what is your personal preference?

How the efficacy figures were arrived at

It is difficult to give definitive figures for contraceptive efficacy, due to a diversity of populations studied and methods used. The figures have been derived by expert consensus using results from a variety of studies, selecting figures from studies which appear to be most comparable to Australian conditions.
